

# Practice 5

## Sample 1

Become very familiar with reading content from a text file. See if you can write a script that creates a simple text file like:

```
cow
goat
pig
horse
```

Then your script should loop through each of those lines and print them out. See if you can do it with a for loop, then see if you can do it with a while loop. After you have written your solution, look at my solution [here](#).

## Sample 2

Write a program that will download the file found [here](#). Loop through each of the words within the file. As you loop, if the word equals `the`, replace it with `COW`. The word `a` should be replaced with `xxxx`. The word `to` should be replaced with `98767`. All other words should remain the same.

After you have written your solution, or if you get stuck, check out my solution [here](#)

Things to pay attention to:

- Spacing: remember no space around assignment operator, but yes space around comparison operators `==`.
- Line spacing and indentation don't matter.
